

Adjustable starter section for Sirius stove installations

Designed for easy installation and removal for inspection. Our awarding winning adjustable starter section is now available for the Sirius stove as an easy and quick way of disconnecting the Sirius stove for inspection, as well as being very easy to install.

The process involves inserting the male spigot of the liner into the appliance spigot, sealing it, re-inserting the insulation wrap around the liner spigot and then simply sliding down the case to cover the stove spigot. Removal for servicing and re-installation is just as easy and is the same process in reverse, with one additional final step, which is to loosen the locking band on the liner to be able to slide the liner up out of the appliance spigot, so the appliance can be moved.

Features	Benefits
Adjustable case.	Sliding case allows for easy installation and removal for inspection and maintenance.
Adjustable liner	Fixed in position on delivery with a locking band. By loosening the locking band, the liner can slide up to allow for it to be disconnected from the appliance spigot for servicing etc
Lightweight	Easy to handle.
